Future Work

The Source Engine

Created by Valve

- Two ex-Microsoft Employees started in 1996
- Began with the release of Half Life in 1998
- Originally a modified version of the Quake gaming engine
- Known initially as \$Gldsrc
- Modified further into Source engine

The Source Engine - Cont'd

More commercial success

- Counter-Strike released in 2000
 - Most actively played online game in the world
- Need to aggregate and control game patches
- Steam was released in 2003

The Source Engine - Cont'd

- One of the leading game engines in the world
- Released titles such as:
 - Half Life 1 & 2
 - Portal 1 & 2

- Left 4 Dead 1 & 2
- Ongoing constant development

What is Steam?

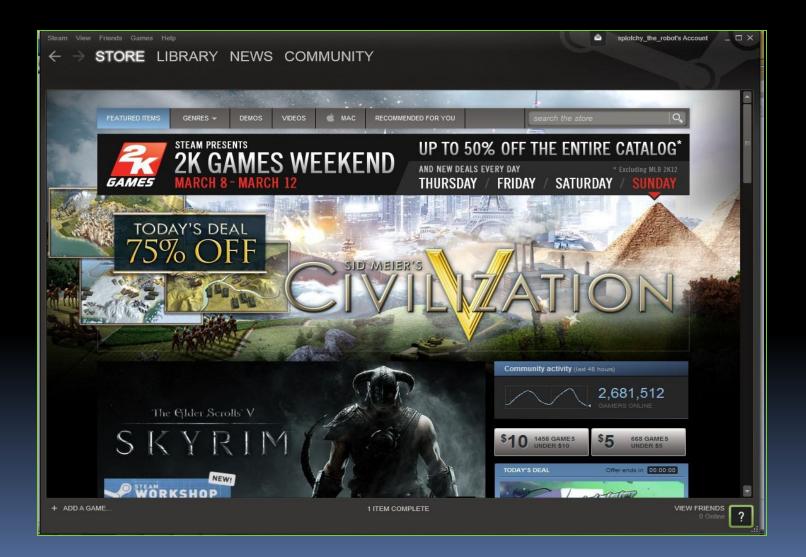

- PC based gaming solution
- Store

- Game Management
- Statistic Aggregation
- Patch Aggregation
- Social network

The Steam Interface

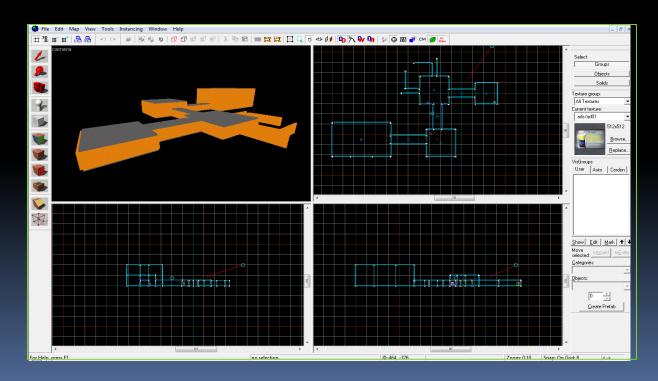

Steam Usage

- 1523 games available
- 40 million active user accounts
- 5 million concurrent players on January 2, 2012
- 70% of the digital distribution market in 2009
- Continual growth

Hammer

- Official level (map) creation tool
- Used on all Source games
- Free with Source games

Tools Within Hammer

- Hammer is a set of tools to create, develop, and publish Source maps
- Main game creation interface
- Game logic

Tools to compile map data into playable levels

Exploiting the Source Engine

- Main focus of this project
- Use video game files to hide data
- Text Messages
- Images

Steganography

What is Steganography?

Hiding Data Within Data

- Security Through Obscurity
- Only Sender/Receiver Recognize Data
- Advantages Over Encryption

Why Video Games?

- Size Plenty of room to hide data
- Common Video game installations are not out of place on computer systems
- Dynamic Video game files are intended to change repeatedly
- Untraceable Information Data hidden in these files cannot be viewed on a dead system
- Open Source Files Source specific

Embedding Text With Brushes

- Brushes are main level geometry
- Brushes can be manipulated to form words and messages
- Most basic data hiding technique
- Easy to accomplish

- Tedious to execute
- Impossible to detect on disk

Embedding Text with Overlays

- In-Game messages
- Physical locations
- Implemented with Entities
- Env_instructor_hint
- Info_target

- Relatively easy to implement and use
- Detectable on disk by investigator

Investigating Source Games

- Source games can be used to hide data
- Investigators must have a way to recover this data
 - Forensic Toolkit (FTK)
 used for investigation

Issues Facing Investigators

- Multitude of game files
- Size of game file installations
- No native support in investigative software
- Reliance on non-forensic level tools
- Viability in court

The First Step: Finding Game Files

- The first step in the investigative process is to identify and locate game files
- Two main approaches
- Game directory structure
 - Steam\steamapps\common\gamename\addons
- File header

Finding Game Files - cont'd

- Once a VPK has been found, it must be decompressed and unpacked
- GCFScapeTool

- Allows users to view and extract files from a VPK
- Used by an investigator to work with data

Investigating Data Hidden with Brushes

Impossible to do

- Cannot be detected in disk
- Only visible when game is played

Investigating Data Hidden with Overlays

- Data hidden in overlays can be recovered on disk
- VPK file must be decompressed
- Data resides in *mapname.bsp* file
- Stored in "entity lumps"
- Search for keywords

- "hint_caption" followed by message
- "hint_caption" "Malicious information here!"

Investigating Data Hidden with Textures

- Identification
 - File System structure
 - Header

- oX5654 4600 0700 VTF \o
- Once identified, textures can be investigated
- VTFEdit may be used

Conclusion

- Data privacy is a right of every individual
- Sometimes this right can be abused
- Data can be hidden in Source game files
- Investigators have ways to recover this data, albeit rudimentary
- The widespread impact of data hidden in this way drives demand for solutions on both sides

Future Work

- New methods of data hiding
- New methods of data recovery
- Development of investigative tools
 - Support for Source files in FTK and others
 - Forensic verification
- Expansion to other game engines
- Expansion to other platforms
